

Project 02: Customer Churn Diagnostics (SaaS, UK)

Business Analytics • Customer Retention • Excel • Power BI

Objective

To diagnose customer churn in a fictitious mid-sized UK-based SaaS company by identifying high-risk customer segments, key churn drivers and actionable retention opportunities using quantitative and qualitative analysis

Business Context & Rationale

CloudWorks, a fictitious UK-based SaaS company offering a subscription-based productivity platform observed rising churn, particularly among early-stage customers and flexible contract users.

Customer churn directly impacts recurring revenue and increases customer acquisition costs. Retaining existing customers is more cost-effective than acquiring new ones, making churn reduction a strategic priority.

Data & Tools

Category	Description
Data Source	Telco Customer Churn – public telecom customer churn dataset, adapted to represent a SaaS subscription business
Tool: Excel	Data cleaning, pivot-based diagnostics, analysis
Tool: Power BI	Interactive dashboard, KPI visualisation

Process Overview

1. Cleaned and structured customer-level churn dataset.
2. Defined churn metrics and tenure-based customer segments.
3. Conducted churn diagnostics across contract type, tenure, and support access.
4. Synthesised quantitative findings with qualitative signals.
5. Developed actionable, business-oriented recommendations.

Key Findings

- Customers on a month-to-month contracts exhibit the highest churn rates.
- New customers (0-6 months) show the highest churn (54.27%).
- Customers without subscription for technical support churn more frequently.
- Higher monthly charges are associated with increased churn risk.

Recommendations

- Incentivise long-term contracts through discounts or value-adds.
- Strengthen early onboarding with guided setups and proactive check-ins.
- Introduce or clearly communicate tiered technical support offerings.
- Improve value communication for higher-priced plans.

Key Deliverables

- [Executive Churn Dashboard \(PDF exported from Power BI\)](#)
- [Full Project Repository \(GitHub\)](#)

Limitations & Assumptions

- Dataset adapted from telecom domain to SaaS context
- No direct customer interviews, hence qualitative signals are inferred from patterns
- Results intended for diagnostic insight, not predictive modelling
